

NCFF Oral Health Initiative

Since 2006, NCEF has invested over \$15,045,114 into the community.

The Issue

Oral Health is essential for child wellbeing, and untreated oral diseases can cause pain, infections, and problems with eating and speaking, which impacts a child's ability to learn and grow. Dental caries (tooth decay) is among the most common chronic childhood diseases, ahead of asthma and hay fever. Oral health care is the most prevalent unmet children's health need especially in low-income, minority, and rural communities. While oral health faces challenges throughout the United States, the problem is perhaps most challenging in Florida.

Florida was one of just three states receiving a 'F' grade in two consecutive Oral Health Report Cards issued by the Pew Center on the States. The grade was largely due to extremely low Medicaid reimbursement rates, the nation's lowest dental care utilization by Medicaid recipients, the lack of an oral health surveillance system, and one of the nation's most restrictive state practice acts on dental hygienists' ability to independently provide preventive services. In addition, more than 20% of Florida's population lives in designated Dental Health Professional Shortage Areas. The number of dentists needed to remove the shortage designation (1,230) is higher than any other state and accounts for 13.36% of the total number of dentists estimated for the entire country (10,716).

Fast Facts*

- In 2020, the Department of Health reported **287 active dentists** in Collier County, but less than **2%** accepted Medicaid patients, thus limiting access to quality care for impoverished children.
- About 1 of 5 (20%) children aged 5 to 11 years have at least one untreated decayed tooth.
- 1 of 7 (13%) adolescents aged 12 to 19 years have at least one untreated decayed tooth.
- School sealant programs are highly effective, with every tooth sealed saving **more than \$11** in dental treatment costs.
- Children aged 5 to 19 years from low-income families are twice as likely (25%) to have cavities, compared with children from higher-income households (11%).
- On average, 34 million school hours are lost each year because of unplanned (emergency) dental care, and over \$45 billion in US productivity is lost each year due to untreated dental disease.

Collaborative Successes

- Spearheaded a unique public private partnership to build and maintain the NCEF Pediatric Dental Center at Florida Southwestern State College in East Naples, which opened in December 2008 and has since had over 176,763 pediatric dental visits.
- In 2013, NCEF developed Collier County's first oral health surveillance system to increase the availability of preventive services in the area, including a school-based dental sealant program for all second-grade children in low socio-economic schools. UF Dental Hygienists conducted screenings for third graders of all public schools in Collier County. Nearly 3,000 children are screened each year. The prevalence of dental sealants on permanent first molars among 3rd graders has increased by 60%.
- The Center's promotora (health educator) has provided oral health education to over 9,000 families.

Meet Deisy, Age 9

Deisy, age 9, has Down Syndrome (DS), which complicates her dental care. Children with DS are prone to crowded teeth and often need their parents' help to brush, and have trouble verbalizing when they are in pain. At NCEF's Pediatric Dental Center, Deisy received treatment with a gentle touch, successfully having three teeth extracted, two cavities filled, and two stainless steel crowns placed. She left with all smiles.

How your dollars make a difference:

- \$1,000 provides oral health education classes for 175 families.
- \$5,000 provides 75 children with dental sealants to prevent decay.
- \$10,000 provides 600 children the opportunity to be treated by a pediatric dentist in one month.
- \$25,000 provides 50 children with comprehensive dental exams.
- \$50,000 provides oral surgery for 10 children including IV sedation.
